This English version is a translation of the original Icelandic document (Almenn viðmið og aðferðafræði vegna könnunar- og matsferlis hjá fjármálafyrirtækjum, 3. útgáfa). In case of any discrepancy, the Icelandic original text will prevail.

1. Introduction

Institutions are required to operate a secure risk management system, cf. Art. 17 of Act No. 161/2002, and must address risks in their operations in accordance with Art. 78 (a) – Art. 78 (i) of the same Act. The Board of Directors and managing director of an institution shall regularly assess the level, composition and distribution of the institution's capital needs based on its level of risk, cf. Par. 1 of Art. 80 of Act No. 161/2002. This process is carried out in the internal capital adequacy assessment process (ICAAP) and internal liquidity adequacy assessment process (ILAAP), results of which relevant institutions report to the Financial Supervisory Authority (FME) annually.

The FME assesses the risks inherent in the activities of an institution in the supervisory review and evaluation process (SREP), in accordance with Art. 80 and 81 of Act No. 161/2002, cf. Ar. 86 (g) of the same Act. In the SREP the FME also evaluates how relevant institutions address risks in their operations, cf. Art. 79 of Act No. 161/2002, among other things, with reference to the ICAAP and ILAAP reports. A comprehensive SREP is either performed annually, biannually or every three years, depending on the size and nature of the institution and its activities. However, assessment for certain key risks is performed annually and monitoring of key risk indicators is carried out at least every quarter.

The purpose of this document is to define and describe the criteria, procedures and methodologies applied in the FME's assessment of relevant institutions' overall risk level and need for capital, i.e. SREP.¹ The methodologies are in accordance with the European Banking Authority's *Guidelines on common procedures and methodologies for SREP*², implemented within the European Union in 2016. The EBA Guidelines contain a more detailed description of the methodologies the FME applies.

Chapter 2 gives an overview of the methodologies applied in the SREP, describing how institutions are categorised according to size and significance, how key risk indicators are monitored, how assessment for individual risks is carried out, overall risk assessment, supervisory measures and the SREP score are determined. Chapter 3 articulates the FME's assessment of capital requirements, setting of capital buffers, supervisory measures for insufficient capital etc.

In addition to these common criteria and methodologies, the FME has published three Annexes. Annexes 1 and 2 provide descriptions of the FME's supervisory benchmarks and supervisory calculations on credit and concentration risk³ and market risk.⁴ Annex 3 describes the methods used for the setting of capital buffers.⁵ Annexes are not published for other risks, such as operational risk, where calculable benchmarks for capital needs are unsuited to define in advance. Publication of these criteria and procedures are in accordance with the FME's transparency policy. However, not all details of the methodologies of the FME will be disclosed. As an example, neither a complete list of variables for the categorisation of institutions will be disclosed, nor individual

¹ The criteria and methodologies described in this document are an addition to information that the FME has published pursuant to Art. 116 (a) of Act No. 161/2002: <http://www.fme.is/um-fme/gagnsaei-i-efirliti/>

SREP scores, as such disclosure may increase the probability of regulatory arbitrage and, in some cases, counteract the use of supervisory judgment in the SREP.

2. Supervisory Review and Evaluation Process (SREP)

2.1 General

The flowing table below (Image 1) gives an overview of the common SREP framework. Chapters 2.2-2.6 below describe different elements of the SREP found in the flowing table.

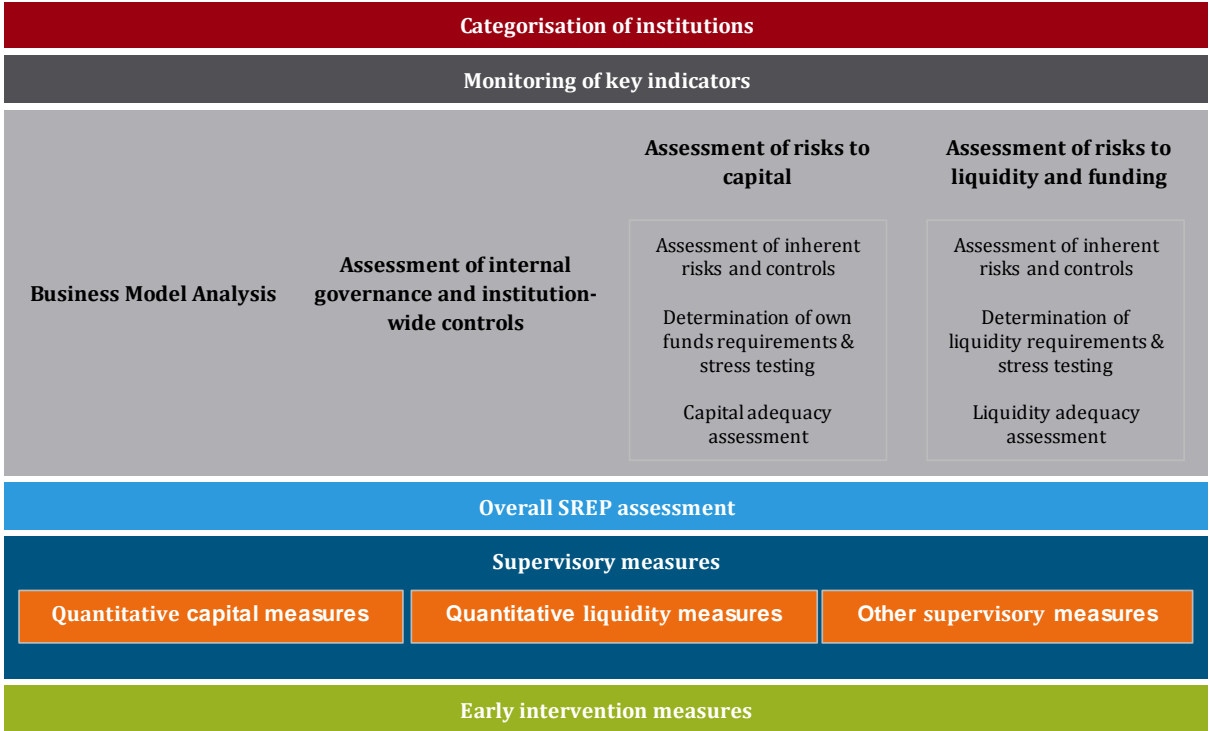

Image 1: The SREP framework

2.2 Categorisation of institutions

The FME applies the principle of proportionality in its supervisory activities, that is, categorises institutions based in their size, structure and complexity, with the aim of prioritising its supervisory oversight and engagement. For this purpose, the FME divides institutions into four impact categories.

The categorisation of institutions by impact is based on a model where an institution is categorised using parameters defined by the FME. The values are collected from regularly reported data provided to the FME (*i. reglubundin gagnaskil*), inspections and other relevant information acquired by the FME.

The parameters of the model reflect five elements of the impact assessment: *size, inter-relationship, substitutability, complexity and scope of international activities.*

Table 1: Impact Categorisation of Institutions

Impact Category of Institutions	Description
High impact institutions	Institutions that can threaten financial stability when ailing or failing.
Medium-high impact institutions	Institutions that do not threaten financial stability when ailing or failing but can have notable effect on the economy and large groups of customers.
Medium-low impact institutions	Institutions that generally do not affect the financial system if ailing or failing but can have notable effect on customers.
Low impact institutions	Institutions that have minimum effect on the financial system and only a small group of customers will be affected when ailing or failing.

To ensure appropriate supervision of all institutions the FME has defined the *minimum engagement model* where the nature and frequency of the supervisory engagement is defined for each impact category. The minimum engagement model generally indicates the supervisory engagement necessary to provide an overview of all risks in the activities of an institution. Reflecting this, the assessment of key risks is more frequent for institutions categorised as *high impact institutions* than for institutions of lower impact categories. Generally, the nature of inspections, and time allocated to them, are determined by impact category and the nature of the institutions’ activities.

2.3 Monitoring of key risk indicators

In addition to its observance of financial market developments, the FME monitors key risk indicators of relevant institutions at least every quarter. Monitoring of key risk indicators is mainly based on regularly reported data and can indicate changes in risk or exposure in the activities of institutions, or indicate risks that need further enquiry. The FME regularly reviews the key risk indicators monitored. Key risk indicators of the FME are *inter alia* based on the common risk indicators of the EBA.⁶

2.4 Assessment of risks

The FME performs risk assessment for key risks in the activities of relevant institutions. Generally, the assessment is updated every quarter with respect to the key risk indicators, but more frequently if necessary.

⁶ EBA risk indicators and detailed risk analysis tools: <http://www.eba.europa.eu/risk-analysis-and-data/risk-indicators-guide>

The risk assessment is performed with inspections and data analysis that can identify risk in the operations of institutions and can be directed at individual risks in individual institutions or in multiple institutions simultaneously. The risk assessment is carried out utilizing, among other things, regularly reported data, results of off-site inspections and on-site inspections.

Assessment of individual risks is based on the inherent risk and the risk management systems that exist within the institution. The risk assessment is thus intended to assess the underlying risks in the activities of an institution, taking into account the actions taken by the institution to counteract or minimise that risk. Scores are assigned to individual risks as a result of the risk assessment (see Chapter 2.6 below for further discussion on the scores).

2.4.1 Analysis of business model

Business model analysis aims to identify possible threats to the viability⁷ of the business model and the sustainability⁸ of the overall strategy of the institution. The business model and overall strategy are evaluated given the risk appetite of the institution and performance of recent years. Assumptions for the expected development of income, costs and capital are reviewed and evaluated.

The analysis is based on the business model of the institution, the ICAAP report, regularly reported data and other data requested by the FME. The data is compared to results of previous SREPs and business models of other institutions. The analysis is supported and guided by an EBA supervisory handbook for business model analysis. The institutions' position in the current business environment is evaluated, financial statement analysed and various qualitative and quantitative aspects of the business model are assessed. The FME also uses stress testing to determine the impact of a baseline scenario on institution's income statement and balance sheet and whether its own funds are sufficient to meet the overall capital requirement over the forecast period.⁹

2.4.2 Assessment of internal governance and institution-wide controls

An assessment of internal governance and institution-wide control includes whether institutions fulfil the requirements for proper governance and internal control, whether there are comprehensive management and control systems within the institution, and whether risk management and internal control is proportional to the risk level, nature, scope and activities of the institution. In this evaluation process consideration is given to whether governance and internal control themselves generate risks and affect the viability of the financial institution.

The assessment covers governance, organisational structure, corporate and risk culture, background, experience and composition of the Board of directors, the institution's remuneration policy, bonus and incentives schemes, risk management, internal control, contingency planning and information technology systems. However, the assessment does not include risk management and internal control related to individual risks. The assessment is based on the ICAAP report of the institution, regularly reported data and other data submissions, interviews with board

⁷ Viability of the business model: Ability to generate sufficient returns over the short term (next 12 months).

⁸ Sustainability of the overall strategy: Ability to generate sufficient returns over the long term (at least 3 year projection).

⁹ Guidelines No. 2/2015 on Stress Testing: <https://www.fme.is/log-og-tilmaeli/leidbeinandi-tilmaeli/nr/2349>

members, directors and other employees of the institution, and information acquired in on-site inspections. In this assessment, the FME uses FME Guidelines No. 1/2016¹⁰ on internal governance of financial institutions (based on EBA Guidelines).

2.4.3 Assessment of risks to capital

Risk assessment for critical risks that affect own funds of institutions is performed systematically. Inherent risk is assessed and the standard of risk management and internal control is evaluated for all relevant risks. The following risks are evaluated *inter alia* with regard to the estimated own funds requirements:

Credit, counterparty and concentration risk¹¹

According to Art. 78 (a) of Act No. 161/2002 institutions utilise their own methodologies when assessing credit and counterparty risk from exposures from individual borrowers, securities, securitised exposures and their entire credit portfolios. Additionally, pursuant to Art. 78 (c) of the same Act institutions shall assess and manage concentration risk arising from individual counterparties within the same sector of the economy, in the same geographical area or in the same industry. Furthermore, institutions shall, with documented plans and procedures, manage remaining risk if measures for credit risk mitigation prove insufficient, cf. Art. 78 (b) of Act No. 161/2002.

Credit risk is the risk of losses arising from a borrower failing to make required payments as they fall due. Counterparty risk refers to risk of loss because the counterparty to a derivatives trade, securities loan or a repurchase agreement does not fulfil its obligations in accordance with the agreed terms. Concentration risk refers to the risk of loss due to insufficient distribution of the credit portfolio and is divided into *single name risk* and *sector and geographic risk*.

When assessing credit and counterparty risks the FME focuses on inherent risk and risk management of the institution. Among other things, the FME evaluates the following:

- Composition/distribution of the credit portfolio
- Default rates and how they are managed
- Cancellation of debt and the methodology used for debt cancellation
- Risk mitigation and risk management

Assessing the inherent concentration risk of an institution the FME considers risk that results from a small number of exposures, or exposures that have similar characteristics with reference to defaults. The assessment includes an analysis of the possible correlation of defaults, particularly in stressed conditions. It also includes credit borrower concentration, single name risk and geographic risk, products diversification and concentration of guarantors and collateral.

The FME regularly calls for data and information on own funds and other balance sheet information of institutions to assess credit risk, counterparty risk and concentration risk. The FME also acquires additional information that is utilized in the evaluation process, for example, to verify data and information acquired from the institutions.

¹⁰ Available in Icelandic here: <http://www.fme.is/log-og-tilmaeli/leidbeinandi-tilmaeli/nr/2566>

¹¹ See Annex 1: Supervisory benchmarks for the setting of Pillar 2 additional own funds requirements for credit and concentration risk.

Market risk¹²

According to Art. 78 (e) of Act No. 161/2002 relevant institutions shall have documented plans and procedures to analyse, assess and manage all significant factors that cause or influence market risk and its effects. Market risk is the risk of loss of value due to factors that affect the overall performance of the financial markets.

The FME assesses the inherent market risk of financial institutions and its management, both in the trading book and banking book. Additionally, the FME assesses the following risk sub-categories using its own criteria that, among other things, are based on sensitivity analysis and VaR analysis in accordance with EBA Guidelines on Stressed Value at Risk:¹³

- Interest rate risk
- Equity risk
- FX risk
- Inflation indexation risk

The FME regularly calls for data and information on own funds and other balance sheet information of institutions to assess market risk. The FME also acquires additional information that is utilized in the evaluation process, for example, to verify data and information acquired from the institutions.

IRRBB

According to Art. 78 (g) of Act No. 161/2002 relevant institutions shall analyse, assess and manage the risk of potential interest rate changes affecting its transactions outside the trading book.

IRRBB refers to the prospective risk to the institution's capital and earnings arising from adverse movements in market interest rates that affect the institution's banking book positions.

The FME assesses the standard of a financial institution's management of IRRBB. The impact of sudden up and down parallel shifts of the relevant yield curves (applying a 0% floor) are assessed in accordance with the EBA Guidelines.¹⁴ The impact of these shifts on the present value of interest-bearing assets and liabilities in each currency is the basis for the risk assessment of the FME for the risk.

The FME regularly calls for data and information on own funds and other balance sheet information of institutions to assess IRRBB risk. The FME also acquires additional information that is utilized in the evaluation process, for example, to verify data and information acquired from the institutions.

Operational risk

Pursuant to Art. 78 (g) of Act No. 161/2002 relevant institutions shall have documented plans and procedures to assess and manage operational risk, including risk stemming from risk models and

¹² See Annex 2: Supervisory benchmarks for the setting of Pillar 2 additional own funds requirements for market risk.

¹³ Guidelines on stressed value at risk (Stressed VaR) (EBA/GL/2012/2):

<https://www.eba.europa.eu/documents/10180/104547/EBA-BS-2012-78--GL-on-Stressed-VaR-pdf>

¹⁴ Guidelines on the management of interest rate arising from non-trading activities (EBA/GL/2015/08):

<https://www.eba.europa.eu/documents/10180/1084098/EBA-GL-2015-08+GL+on+the+management+of+interest+rate+risk+.pdf>

from rare events that may have serious effects. Operational risk is the risk of losses stemming from inadequate or failed internal processes, people and systems or from external events.

Sub-categories of operational risk include:

- Compliance risk
- Conduct risk
- Legal and political risk
- Model risk
- Information technology risk
- Reputational risk

The FME assesses the inherent operational risk, centered on the above-mentioned sub-categories and other risks that are considered of particular interest, and the management and control of these risks within the institution.

The FME regularly calls for data and information on own funds and other balance sheet information of institutions to assess operational risk. The FME also acquires additional information that is utilized in the evaluation process, for example, to verify data and information acquired from the institutions.

2.4.4 Assessment of risks to liquidity and funding

Institutions must continuously address their ability to monetise their liquid assets in a timely fashion in order to meet their deposit withdrawals and other payment obligations, cf. Art. 83 of Act No. 161/2002.¹⁵ Institutions are required to formulate and implement strategies, policies, documented procedures, methods and systems to analyse, assess and control liquidity and funding risk, cf. Art. 78 (h) of the same Act.

The FME's assessment of an institution's liquidity and funding needs is an important part of the SREP, cf. Par. 2 of Art. 79 and Par. 2 of Art. 81 of Act No. 161/2002.¹⁶ The assessment is based on three factors: First, an assessment of liquidity and funding risks management. Second, an assessment of the inherent liquidity risk. And third, an assessment of the inherent funding risk.

The assessment of liquidity and funding risk management includes evaluation of the liquidity strategy and whether the institutions operate under the approved policies, procedures and controls. The assessment also includes evaluation of stress tests, contingency plans and funding plans.

The assessment of inherent liquidity risk includes an evaluation of liquidity needs in the short and medium term, intraday liquidity risk, liquidity buffers, counterbalancing capacity and supervisory liquidity stress testing.

The assessment of inherent funding risk addresses the funding profile of the institution and its stability, evaluates potential threat to financial stability stemming from the funding profile, the

¹⁵ See also Rules No. 266/2017 on liquidity ratios of credit institutions and Rules No. 1032/2014 on funding ratios in foreign currencies.

¹⁶ The FME and the Central Bank of Iceland cooperate on supervision of liquidity risk of financial institutions, see here: <http://www.fme.is/media/um-fme/Samstarfssamningur.pdf>

market access of the institution and the expected change in funding risks with reference to the institution's funding plan.

The FME's assessment of the above-mentioned factors is based, in particular, on FME Guidelines No. 2/2010 on best practice of liquidity management¹⁷, ICAAP and ILAAP reports, regularly reported data, on-site inspections and other information that may be relevant to evaluate liquidity and funding risks and considered important to complete the assessment.

The outcome of the assessment may lead to requirements for improved management and control of the risks or an increase of liquid assets.¹⁸ The outcome may also lead to requirements of extending maturity, additional own funds, reduction of off-balance-sheet exposures, etc.

2.5 Overall SREP assessment and application of supervisory measures

In the annual overall SREP assessment, results of individual risk evaluations are collected and aggregated. An overall SREP assessment is completed for all relevant institutions regardless of the frequency or detail of individual risk evaluations during the process. The overall SREP assessment is reflected in a risk score (see Chapter 2.6 below).

After the completion of the overall SREP assessment the FME engages in a dialogue with the institution and informs the institution on corrective actions with which it is obliged to comply with. Supervisory measures may include own funds measures, liquidity measures and other supervisory measures. Corrective actions warranted to an institution are an act of administration, cf. Administrative Procedures Act No. 37/1993, and are formally reported to the institution.

2.6 Scoring

Scores are attached to individual risks and to the overall SREP assessment. The scores are utilised by the FME to prioritise projects and engagement, and they are considered a part of the FME's risk-based supervisory architecture. However, they do not directly affect specific requirements for corrective actions (for instance, own funds requirements), and are not disclosed to individual institutions. The rating scale is from one to four (see Table 2).

¹⁷ <http://www.fme.is/log-og-tilmaeli/leidbeinandi-tilmaeli/nr/921>

¹⁸ According to an agreement between the FME and the Central Bank of Iceland (CBI) on supervision of liquidity of financial institutions, the FME proposes to the CBI special liquidity measures if necessary.

Table 1: Risk scores overview

SREP score	Description
1	Minimal risk identified.
2	The risk identified is limited but better performance can be achieved. Critical to monitor possible weaknesses in the operations of the institution.
3	The risk identified poses medium-to-high levels of risk to the institution. Necessary to observe and monitor the institution and insist on corrective actions.
4	Very high levels of risk identified in the operations of the institution. Necessary to engage, use supervisory measures and insist on corrective actions without delay.

The overall risk assessment can also result in a score of 'F' indicating that the institution is "failing or likely to fail." 'F' score might result in measures taken pursuant to Ch. XII and Temporary Provision VI of Act No. 161/2002.

3. The FME capital requirements

3.1 General

The FME's decision on additional own funds requirements under Pillar II is two-fold:¹⁹

- Pillar II capital requirements (P2R) for risks, that is, the risk of expected losses and unexpected losses insufficiently covered by Pillar I,²⁰ over a 12-month period.
- Pillar II capital guidance (P2G) to meet stressed conditions, that is, possible risk of losses caused by adverse conditions over the economic cycle not covered sufficiently under Pillar I and Pillar II requirements, or relevant capital buffers.

¹⁹ Pursuant to Par. 7 of Art. 86 (g) of Act No. 161/2002, Pillar II capital maintained must be comprised of at least 56.25% CET1 capital and 75% Tier 1 capital.

²⁰ Pillar I is the minimum own funds requirement, that is, eligible own funds maintained at least 8% of total risk exposure amount, cf. Par. 1 of Art. 84 of Act No. 161/2002. Pillar I eligible own funds shall be comprised of Tier 1 capital, cf. Art 84 (a) and 84 (b), Tier 2 capital, cf. Art 84 (c), net of deductions, pursuant to Art. 85. Thereof, CET1 capitals shall, net of deductions, be at least 4.5% of total risk exposure amount and Tier 1 capital shall be, net of deductions, at least 6% of total risk exposure amount.

3.2 Pillar II-R: The FME's assessment of capital requirements for risks

3.2.1 General

According to Par. 1 of Art. 84 of Act No. 161/2002²¹ a relevant institution's own funds must be at least 8% of its total risk exposure amount.²² The Board of directors and managing director of an institutions shall regularly assess the level, composition and distribution of the institution's capital needs based on its level of risk, cf. Par. 1 of Art. 80 of Act No. 161/2002. The assessment is carried out internally and reported with an ICAAP report to the FME.

The FME evaluates risks relevant to the capital needs of institutions in accordance with Art. 79-81 of Act No. 161/2002, cf. Art. 86 (g) of the same Act. The FME's assessment rests mainly on data regularly reported to the FME, in particular ICAAP reports, financial statements and internal audit reports. Additionally, the FME gathers further information through dialog with institutions and with specific inspections during the SREP.

The FME's evaluation concludes on whether the institution has taken adequate measures, whether management is sound and own funds maintained are sufficient, given the level of risk entailed in the institution's activities. The conclusion of the FME may result in supervisory engagement where the FME can enforce the following supervisory measures under Par. 4 of Art. 86 (g) of Act No. 161/2002:

- a. Own funds maintained higher than 8% of total risk exposure amount, cf. chapter 3.2.2 below
- b. Improvements to internal processes
- c. To require institutions to present a plan to restore compliance with the requirements of the Act, as well as the regulations and rules derived from the Act
- d. A write-down of assets forming eligible own funds
- e. Restrictions or limits to the institution's activities, or forced selling of assets or components of the business that entail higher risks to the institution
- f. Reduction of the risk entailed by the institution's activities, certain products or systems
- g. Limitations to bonuses as a percentage to net profits, as their pay-out will lead to insufficient own funds
- h. Net profits allocated to strengthen own funds
- i. Dividends and interest payments to shareholders and investors limited or prohibited
- j. Increased data reported to supervisor
- k. Ad hoc disclosure to the market

In addition, the FME can comment and propose action in accordance with Par. 1 of Art. 10 of Act No. 87/1998 on Official Supervision of Financial Activities.

For the determination of additional own funds requirements to cover the risk of unexpected losses, the FME completes a comprehensive assessment of individual risks, supported by the following sources of information:

²¹ See also Regulation No. 233/2017: <https://www.reglugerd.is/reglugerdir/eftir-raduneytum/fjarmala--og-efnahagsraduneyti/nr/20476>

²² Total risk exposure amount is the aggregate of weighted risks, such as credit risk, equity risk, interest rate risk, currency risk and operating risk, entailed by the institution's activities, cf. Art 84 (e) of Act No. 161/2002.

- a. ICAAP calculations
- b. Outcome of supervisory benchmark calculations²³
- c. Other relevant inputs, including those arising from interaction and dialogue with the institution

In an effort to ensure the quality of the FME's evaluation of individual risks affecting own funds the FME has developed risk-specific supervisory benchmarks for certain sub-categories of individual risks. However, the FME emphasizes that institutions develop and apply their own detailed criteria and methodologies in the evaluation of inherent risk. If the FME considers the institution's own criteria and methodologies sufficient and appropriate, the FME favours them proportionally to support the determination of own funds.²⁴ If, however, the FME considers the institution's own criteria and methodologies insufficient or inappropriate, the FME will favour its supervisory benchmarks and judgement to support the determination of additional own funds. In such cases, the FME's result is not meant to substitute the institution's own assessment of inherent risk and the urgency prevails for the institution to evaluate risks of its activities sufficiently.

In the FME's assessment and determination of additional own funds requirements, risk diversification effects arising from individual risks, such as credit and concentration risk, market risk or operational risk (inter-risk diversification) do not reduce the minimum own funds requirements. However, the FME can assess and consider diversification affects arising from risk drivers within each risk category (intra-risk diversification) and comprehensively evaluate own funds requirements for each risk.

3.2.2 Total SREP Capital Requirement

Total SREP Capital Requirement refers to the sum total of the minimum capital requirement, that is, eligible own funds of 8% of total risk exposure amount pursuant to Par 1 of Art. 84 of Act No. 161/2002, and additional own funds requirements determined by the FME. The decision is made with reference to section (a) of Par. 4 of Art. 86 (g) of Act No. 161/2002 that states that the FME is authorized to prescribe eligible own funds higher than 8% of total risk exposure amount. In such cases the institution is required to hold sufficient eligible own funds to meet the FME's prescription.

3.3 Pillar II-G: Capital guidance to meet stressed conditions

Relevant institutions are required to address their need for own funds to meet stressed conditions in their capital planning framework, risk management efforts and recovery planning. Additionally, the institutions shall operate so as to meet their expected capital needs during stressed conditions.

The FME will assess the adequacy of the institution's own funds to cover possible volatility and shocks in stressed conditions. The assessment is grounded in the results of supervisory stress

²³ For further information, see Annexes document.

²⁴ *Sufficient* refers to whether the methodology is statistically strong and sensible. *Appropriate* refers to whether the methodology covers the risks most appropriate in every instance. In its assessment, the FME will, among other things, evaluate if the institution's methods can be considered: detailed, credible, understandable and comparable.

tests. Furthermore, the FME reviews results of stress test of other supervisory bodies and ICAAP stress test of the institution (own scenario).²⁵

The FME's supervisory stress testing assess the sensitivity of the institution's own funds towards adverse scenarios and the institution's ability to meet the Total SREP Capital Requirement under the adverse scenarios over the forecast period. Additionally, the impact of stress tests on the institution's leverage ratio is assessed and considered.

When outcomes of supervisory stress tests suggest that an institution's own funds is expected to go below the capital conservation buffer, and in special circumstances, the countercyclical capital buffer, the FME can set additional capital guidance to meet stressed conditions (Pillar II-G), which is not a part of the Overall Capital Requirement.²⁶ If an institution's eligible own funds held for the purposes of meeting stressed conditions does not meet the capital guidance of the FME, additional supervisory measures may be considered, including increased supervision or additional capital requirement (Pillar II-R) in special circumstances. Where appropriate, Pillar II-G can be set higher than the management buffer, that is, own funds in excess of the Overall Capital Requirements.

3.4 Capital buffers

Pursuant to Art. 86 (a) of Act No. 161/2002 relevant institutions shall, in addition to the minimum capital requirement, maintain the following capital buffers in accordance with Art. 86 (b)-(e) of the same Act:²⁷

1. Systemic risk buffer
2. Capital buffer for other systemically important institutions (O-SII buffer)
3. Countercyclical capital buffer
4. Capital conservation buffer

The FME is required to set capital buffers for all systematically important institutions, following the recommendations of the Financial Stability Council. Additionally, the FME is authorised set O-SII buffers and countercyclical buffers for other institutions, following the recommendations of the Financial Stability Council. The capital conservation buffer adds to the capital requirement of institutions without recommendations from the Financial Stability Council, nor a decision from the FME.²⁸

3.5 Overall capital requirement and supervisory measures for insufficient capital

If an institution does not meet the overall capital requirement, that is, the FME's minimum capital requirement in addition to the combined buffer requirement, cf. Art. 86 (a) of Act No. 161/2002, the allocation of profits, as well as bonus and dividends payment, are limited or restricted, cf. FME

²⁵ Cf. FME Guidelines No. 2/2015.

²⁶ EBA Pillar 2 Roadmap: <https://www.eba.europa.eu/documents/10180/1814098/EBA+Pillar+2+roadmap.pdf>, og Draft Guidelines on the revised common procedures and methodologies for the supervisory review and evaluation process (SREP) and supervisory stress testing (EBA/CP/2017/18): <https://www.eba.europa.eu/documents/10180/2006890/Consultation+Paper+on+Guidelines+on+common+procedures+and+methodology+for+SREP+%28EBA-CP-2017-18%29.pdf>.

²⁷ Capital buffers can only be met with CET1 capital, pursuant to Art. 84 (a) of Act No. 161/2002, cf. Art 86 (a) of the same Act.

²⁸ See Annex 3: Methods for setting capital buffers.

Rules No. 1270/2015 on maximum outbound payments and limits to outbound payments by cause of capital buffers. Additionally, in these conditions, the Board of directors of the relevant institution must submit to the FME documentation describing how the institution will conserve own funds, cf. Art. 86 (f).

Par. 4 of Art. 86 (b) of Act No. 161/2002 states that if an institution does not meet the requirement for the maintenance of own funds above the systemic risk buffer and limits or restrictions of outbound payments, pursuant to Art. 86 (a), Par. 6, are considered insufficient to strengthen own funds of the institution, the FME can enforce the following supervisory measures:

1. Revoke the institution’s operating licence partially or in full pursuant to Art. 9, Par. 1, Point 10.
2. Require corrective actions pursuant to Art. 86 (g), Par. 4.
3. Impose additional liquidity requirements, if the institution does not hold an operating license pursuant to Art. 4, Par. 1, Points 1-3, cf. Art. 6.
4. Appeal to the Central Bank of Iceland, in cases where the institution does hold an operating license pursuant to Art. 4, Par. 1, Points 1-3, cf. Art. 6., to impose additional liquidity requirements.

If an institution does not meet the FME’s minimum capital requirement, i.e. eligible own funds of 8% of total risk exposure amount, cf. Par 1, Art. 84 of Act No. 161/2002, and additional own funds requirements determined by the FME, cf. Art. 86 (g), Par. 4, section (a) of the same Act, standard procedures in response to insufficient own funds are initiated, cf. Art. 86 of the Act. These procedures entail, by further decision of the FME, that the institution is warranted 6-12 months to increase its own funds and meet the requirements. If measures to increase own funds prove inadequate, operating license of the institution is revoked and measures pursuant to Ch. XII and Temporary provision VI of Act No. 161/2002 may come into consideration.

3.6 Decision letter and publication of the FME's assessment of capital needs

The FME informs an institution on the results of the SREP with a decision letter, following a dialogue and after giving the institution an opportunity to express its views on the decisions, cf. Administrative Procedures Act No. 37/1993.

The letter contains the FME's decision on the Total SREP Capital Requirement and is broken down in the following risks:

- a. Credit, counterparty and concentration risk
- b. Market risk
- c. IRRBB
- d. Other risk, that is, operational risk, risk from subsidiaries etc.

The letter also specifies main risk drivers within each risk, and in some cases, lists supervisory measures pursuant to Art. 86 (g), Par. 4 of Act No. 161/2002 that the FME may consider as a result of the SREP.

The FME publishes on its website, via a transparency announcement, a summary of the main results of the SREP, including the Total SREP Capital Requirement and the Overall Capital Requirement.
